

## NEAT – Inspection Tracking

NControl Security Integrations introduces NEAT. NEAT is a scalable system that offers an easy to use and install system which provides the location of all asset and personnel in real-time and reports that show movement history.

The **NEAT** system offers options to enhance the functionality of the system. These options are designated into two different groups. The first group is subsystems, which are applications that are software based options. The second are devices, which are hardware devices with software that are added to the **NEAT** system.

### HIGHLIGHTS

- Ensure periodic inspections are performed as required
- Keeps records of inspections, who performed, what was done and when
- Make sure that your business meets OSHA inspections or other compliance inspections
- Save time and Money

**NEAT Inspection Tracking** a subsystem in **NEAT** that monitors inspection timeframes on specifically designated items that are tracked by the **NEAT** System.

The subsystem allows users to define an initial inspection date on any items defined in the system. As the inspection time nears, the system will generate a report of pending inspections that includes the items, when the inspection is due and the Last Known Location of the item.

The system will indicate pending inspections with an Inspection Alarm that will display on the NEAT System's main console. Users can click the alarm to see what inspections are due.

The subsystem includes an Inspection Performed notes page where notes can be made on the inspections, including as repairs needed, who did the inspection and when the next inspection is due.

Use **Inspection Tracking** to:

- Ensure periodic inspections are performed as required
- Keeps records of inspections, who performed, what was done and when
- Make sure that your business meets OSHA inspections or other compliance inspections

The information saved during the inspections process will be determined by the user to ensure only required information is retained. The system also retains the person who updated the inspection information in the system.

The **NEAT Inspection Tracking** subsystem includes a group of reports so user can view the following:

- List of items that require inspection
- Updated All Assets report that includes the Inspection Date of all items
- A report of inspections performed by item
